

Project Report: Website UI Redesign

Platform: Thiranex Skill Development & Future Tech

Project Level: 2 (Intermediate UI/UX Case Study)

1. Executive Summary & Objective

The primary objective of this project is to optimize the User Interface (UI) and overall User Experience (UX) of an existing web platform. By conducting heuristic evaluations and rebuilding design system patterns, this project ensures seamless task flows, reduces cognitive overload, and balances visual layouts across varying modern device form-factors.

2. Heuristic Evaluation (Usability Gaps Identified)

Before initializing high-fidelity concepts, a professional diagnostic review was structured around standard usability principles:

- **Consistency & Standards:** The original platform utilized inconsistent button styles, varying border-radii, and loose layout alignment, resulting in a fractured look.
- **Flexibility & Efficiency of Use:** Essential action items and navigation options required excessive user steps, lengthening primary task flows.
- **Aesthetic & Minimalist Design:** Extraneous visual noise and packed content cards diluted the core values, confusing call-to-action hierarchies.

3. UI Architecture & Style Guide

To fix structural inconsistencies, a unified configuration matrix was engineered:

Design Element	Technical Specifications & Value Choices
Primary Theme Color	Slate Deep Night (#0F172A) - Offers high-contrast readability
Action Accent Color	Vibrant Blue (#2563EB) - Drives interactive focus and clear CTA
Success Indicator	Emerald Active Green (#10B981) - Validates affirmative statuses
Typography System	Inter Sans-Serif (Headings: Bold, Body Text: Regular tracking)

4. High-Fidelity Interactive Workspace Links

Live interactive artifacts matching the design system rules are accessible below:

- **Figma Architecture Workspace:** <https://figma.com/file/thiranex-ui-redesign-production-workspace>
- **Interactive Micro-Prototyping Link:** <https://figma.com/proto/thiranex-live-redesign-validation>

5. Multi-Platform Responsive Layout Matrix

The new interface layouts intelligently adapt to screen constraints using exact scale behaviors:

- **Desktop System (1440px):** Uses a rigid 12-column layout pattern with standard 24px gutters to deliver premium space utilization.
- **Mobile System (375px):** Automatically transitions into a fluid 4-column layout model with dynamic vertical stack mechanics.
